Michael Said Beshara (36)

DBMS:

A Computer Database is a structured collection of records or data that is stored in a computer system. On the other hand, a Database Management System (DBMS) is a complex set of software programs that controls the organization, storage, management, and retrieval of data in a database. DBMS are categorized according to their data structures or types. The DBMS accepts requests for data from the application program and instructs the operating system to transfer the appropriate data. Extensible Markup Language (XML) (encoding: ISO-8859-1) is a set of rules for encoding documents in machine readable form.

JDBC:

Java Database Connectivity (JDBC) provides Java developers with a standard API

that is used to access databases, regardless of the driver and database product.

JDBC presents a uniform interface to databases - change vendors and your applications only need to change their driver.

Design Patterns used:

✓ **Singleton pattern:**

- OurDriver.
- OurJDBC.

✓ **Object Pool pattern:**

- ConnectionManager.

✓ **InterFace Pattern:**

- IConnection.
- IDriver.
- IResultSet.
- IResultSetMetaData.
- IStatement.

✓ **Delegation Pattern:**

- RelationalCondition.

✓ **Thread:**

- FutureThread.

✓ **ChainOfResponsibility Pattern:**

- In handling errors and Exceptions.

Design Decision:

- The user have to enter a valid path first then a valid URL in order to have a connection.
- The driver requests creating a connection.
- Connection is created by ConnectionManager (Pool).
- Connection creates statements.
- Statements execute queries using DBMS.
- Statements create & set ResultSet & ResultSetMetaData by getting the requested data through DBMS as a table.
- When Statement is executing a query there could be a limit for the execution time using a future thread.
- This time could be set by the driver, is its not set its zero by default.

User Manual:

- This is a simple GUI based application since its available only for developers helping them to manage their data bases.
- The user have to write first path & URL of his workspace in order to request a connection.
- If they are valid, a connection is created and then he can enter his queries.
- Results, errors & warnings appear on a label and in a table.
- If he wants to close the connection, he must write "close", so all unsaved operations are saved and connection is closed.

Sample Runs:

Run

No columns in table

Run

No columns in table

Run

No columns in table

Run

Connection is created.

No columns in table

DELETE From 7;

Run

You have made changes to 6 rows.

select * from 7

Run

Selection is made successfully.

name	id	c
bebo	21	maths
koko	22	maths
mickey saeed	25	mn
bebo	21	maths
Arsany Atef	null	null
bolbol	null	null

insert into 7 (name) values (bolbol);

Run

You have made changes to 1 rows.

delete from 7

Run

You have made changes to 6 rows.

No columns in table

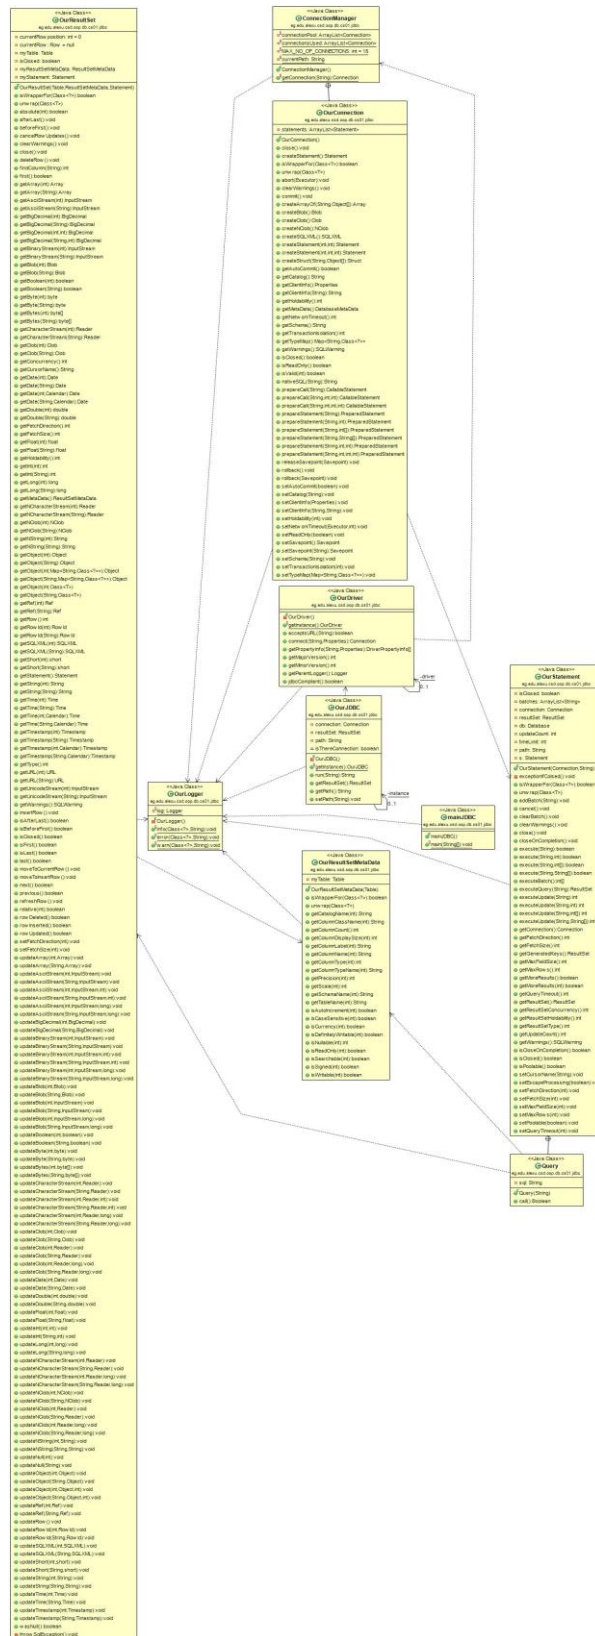

close

Run

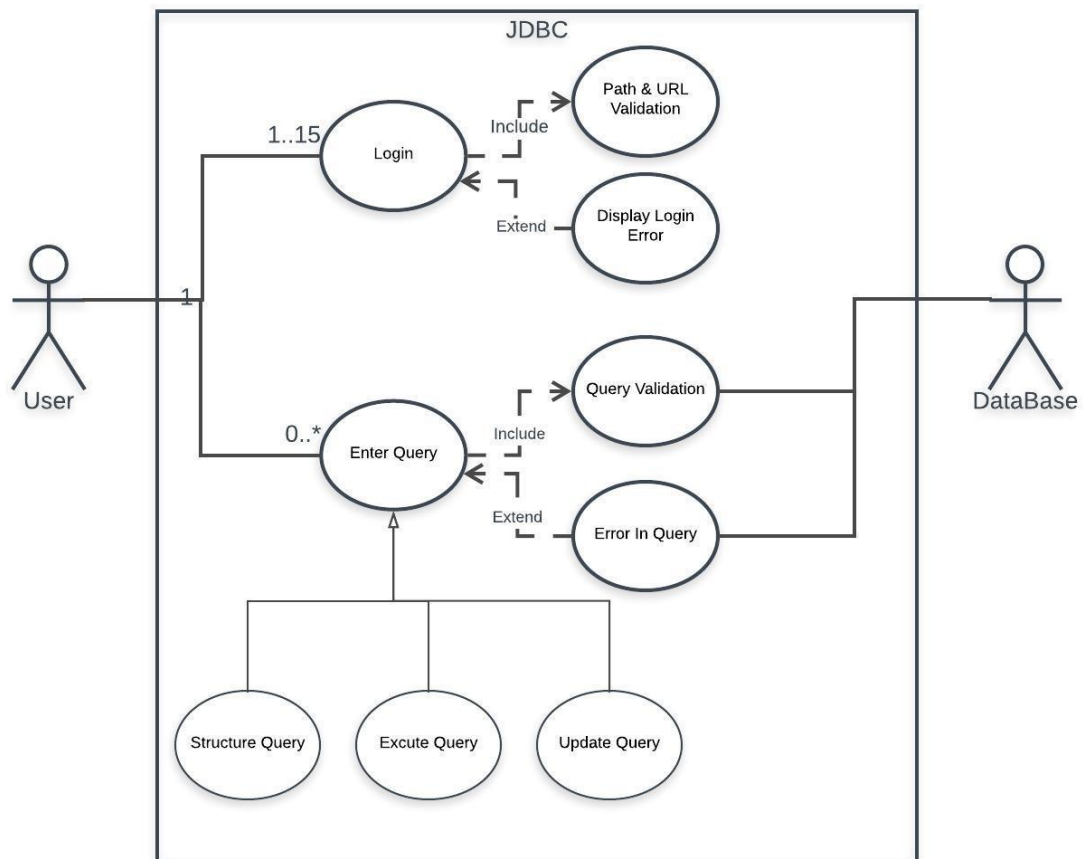

Connection is closed.

No columns in table
